Энэ өрөөнд байгаа хэн нэгэн нь корона вирусын халдвар авсан байж магадгүй юм

NO

Dh 'fhaodadh gum bi bhìoras corona air cuideigin san t-seòmar seo

YES

Someone in this room may be infected with corona virus

Meaning

Meaning

- NONE** Spanish flu killed 20-50 million people worldwide in 1918. Its mortality rate was 10-20%
- LOW** Coronavirus has killed 391 people in 2020, none in the US. Its mortality rate is about 2%
- HIGH** Someone in this room may be infected with coronavirus
- VERY HIGH** The person sitting next to me is infected with coronavirus and wants to shake my hand

Value

Value

Spanish flu killed 20-50 million people worldwide in 1918. Its mortality rate was 10-20%

Prediction

I can't be infected with Spanish flu

Coronavirus has infected over 17000 people in China and killed 391. There are 11 cases in the US.

Prediction

The risk is low that anyone I've had contact with has coronavirus

Someone in this room may be infected with corona virus

Prediction

I am at risk of being infected, potentially high risk if the infected person is someone I've had contact with

The person sitting next to me is infected with coronavirus and wants to shake my hand

Prediction

I am at high risk and even more so if I shake hands

Prediction

Prediction

I can't be infected with Spanish flu

Decision

Don't do anything

The risk is low that anyone I've had contact with has coronavirus

Decision

Avoid travel to high risk areas or with high risk individuals

I am at risk of being infected, potentially high risk if the infected person is someone I've had contact with

Decision

Report to my doctor for a test and try to determine who the infected person is

I am at high risk and even more so if I shake hands

Decision

Decide not to shake hands and report to my doctor

Decision

Decision

Don't do anything

Action

Nothing

Avoid travel to high risk areas or with high risk individuals

Action

Cancel business trip to Wuhan

Report to my doctor for a test and try to determine who the infected person is

Action

Visit doctor, explain situation, consult with ASU health authorities

Decide not to shake hands and report to my doctor

Action

Don't shake hands, apologize to person, visit doctor, explain situation

Action

DMV → PDA

Data + Meaning + Value → Prediction + Decision + Action

Example: DMV → PDA

Data = person sitting next to me is infected with coronavirus
and wants to shake my hand

Meaning (key features) = “physical proximity”, “contact”,
“transmission”, “infected”

Value = High - value on potential very negative health consequences
and on reliability of the data

Prediction = I may be infected with coronavirus if I shake hands

Decision = To politely refuse to shake hands

Action = Don't shake hands

Data Scientists

Data

Data

Data

Data

Data is the
fuel of life
They represent
the "real" world

Datos

Each person is processing about
11 Mb/s from our senses
(3 photos in terms of pixels)

Datos

Datos

We extract meaning from
this data and convert it into
prediction models that we
use for making decisions
and taking actions

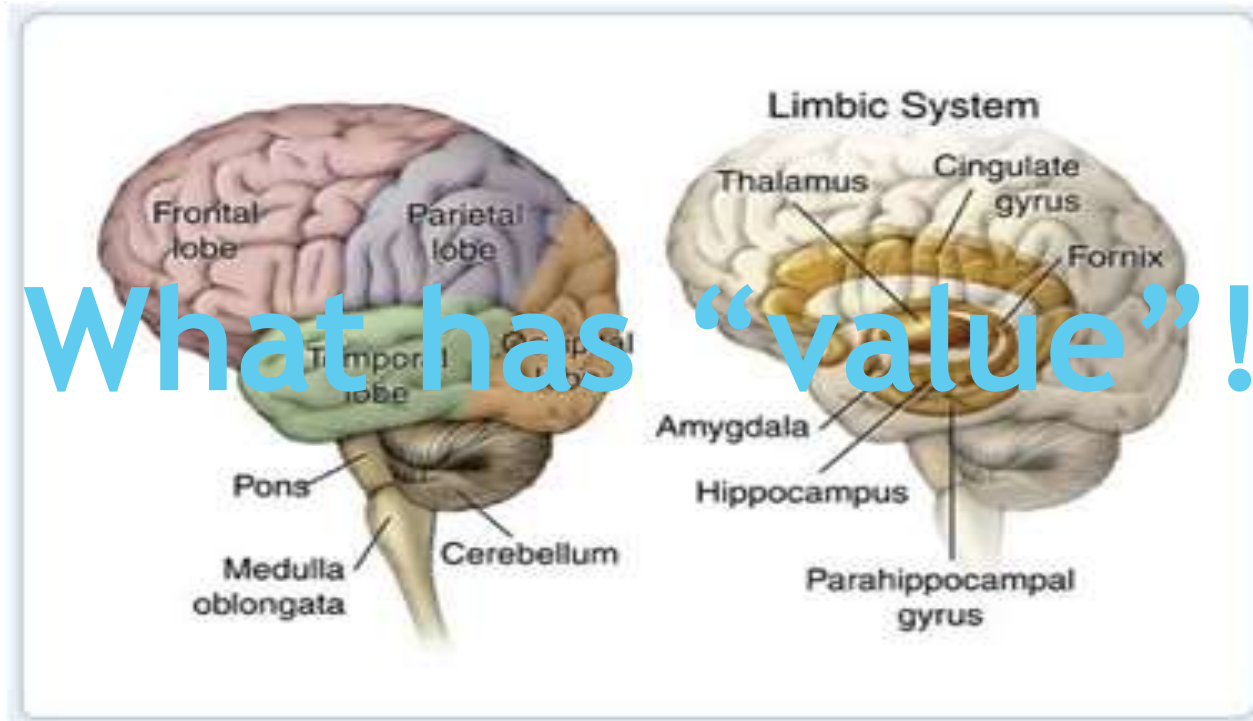

Datos

The human race is processing about
1 yottabyte (10^{24} b/year) from our senses

The human brain can store about 10-100Tb
“hard disc” would be full in 3 months
What does it “choose” to store?

Marketing Intern
ABC Agency
Achievements:
- Increased lead generation of the agency by 20% within the first 6 months by creating 4 "How-to" guides on the blog.
- Contributed to the increase by 35% of new clients in 2017 compared to 2016.
- Increased social media presence of the company by 23% in the last 3 months.
- Drafted a new on-boarding email process that increased the email open rate from 30% to 36%.
- Created 2 marketing-related articles per month which had on average 150 social media shares each increasing brand awareness.

The Data Revolution

The Data Revolution

“Deep” data is more important than “Big” data

$P(C | X(t))$ represents the algorithm's model of reality and perception

DMV → PDA

Heuristic: we know exactly what it is. It's a mathematical model.

Type 2 thinking

There are many alternatives to any decision and many possible actions

Artificial “Intelligence”
Did it work?

DMV → PDA is judged to be good or bad according to a performance criterion

Human versus Artificial Intelligence

$$P(C | X(t))$$

A representation of DMV → PDA
It's a Machine

Sensorial/physical/analog -
Always hugely multi-factorial
Always has meaning

There are a huge number of
goals, each with an associated value

We don't know the heuristic but
do know its VERY biased

$$X(t)$$

Electronic/digital/binary - very biased
And not very multi-factorial
No meaning

$$C$$

There is just one goal that we have
to pre-specify (with bias) as well
as specify the value (with bias)

$$P(|)$$

We know exactly the heuristic
and its (weak) bias and variance

What is a machine?

Machines are created to do one particular task better than a human

These are physical machines

Machines are specialists

- You can't drive a hammer. You can't prepare coffee with a watch. A human being can prepare coffee, tell the time and decide to drive to work - if he has the appropriate tools. Humans are generalists with Generalized Intelligence. We are meta-machines that use other machines.

Machine Learning is associated with the development of algorithms that perform like physical machines, i.e. they do one thing well. Sometimes very well. Sometimes better than a human. Just like a hammer!

$$P(C | X(t))$$

It's a machine that takes DV as an input and gives a P and potentially a DA as an output.

Obesity and Metabolic disease

Imagine a problem that cost ...

and you invested ...

Obesity is one of the top three global social burdens generated by human beings

Estimated annual global direct economic impact and investment to mitigate selected global burdens, 2012¹
GDP, \$ trillion

1 Based on 2010 disability-adjusted life years (DALY) data from the Global Burden of Disease database and 2012 economic indicators from the World Bank, excluding associated revenue or taxes; including lost productivity due to disability and death, direct cost, e.g., for health care, and direct investment to mitigate; GDP data on purchasing power parity basis.
 2 Based on historical development between 1990 and 2010 of total global DALYs lost (Global Burden of Disease).
 3 Includes military budget.
 4 Includes functional illiteracy.
 5 Includes associated crime and imprisonment.
 6 Includes sexually transmitted diseases. Excludes unwanted pregnancies.
 7 Excludes lost time to access clean water source.
 SOURCE: Literature review, World Health Organization Global Burden of Disease database; McKinsey Global Institute analysis

and it got worse and stupid people make “

people are stupid, they deserve what they get?

Rapacious capitalism?

Evolutionary determinism?

Or is it all of these and thousands of other factors that also influence it?

table
le

And now P and V!

1. Prediction - If I eat this, I will enjoy it

Value - High - Physiologically and psychologically set - Type I thinking

2. Prediction - If I eat this, I will be diabetic and hypertensive in 20 years

Value - Low - Cognitively set - Type 2 thinking

The Mental Model $P(C|X(t))$ necessary to make 2. take precedence over 1. is enormously difficult to obtain. The evolutionary cards are stacked against us.

The Conductome Landscape

Behaviour change –
Just how plastic is it?

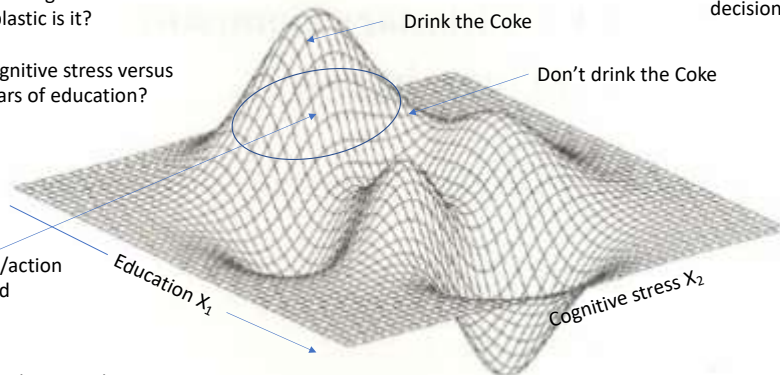

Reduce cognitive stress versus
5 more years of education?

Decision/action
threshold

Education X_1

Cognitive stress X_2

(X_1, X_2) – Conductome dimensions

The Conductome landscape
is dynamic and adaptive.
There is a landscape for every
decision/action/behaviour

And now M and D! Here's a D.

Project 42 - the goal - to build the “deepest” database on the planet for obesity and metabolic disease. Over 3000 university academics, workers and students and over 2000 variables.

And the M?

Why do shorter people tend to be more obese?

Have you ever seen portions that were sized to your size?

And the M?

Difference in perceived BMI versus real BMI

We all live in an alternative reality.

For some its really different.

We can quantify the difference and ask why some people have bigger differences than others.

There is a reality

We just don't have the data to reconstruct it

Yet...

The Data Revolution is making it feasible

But Human Intelligence is so
biased it can just ignore the data

Oil Pipeline leaks

DMV

The problem: Predict the risk of an oil pipeline leak while minimizing false positives and still capturing the leaks

Data: Time series of flowrates, pressures, densities, pump states, drag reducing agents, valve positions, weather, time of year, pipeline topography, pipeline topology, exogeneous/endogenous changes,...

“IoT”

Meaning: Conservation of mass, Newton’s laws, confounding factors - need an engineer’s or physicist’s intuition

Value: Avoid environmental damage, brand loss, litigation, operator burnout, expensive pipeline revisions,...

Oil Pipeline leaks

Meaning

Looks like a leak of over a 1000 bph and it lasts more than 15 min

Oil Pipeline leaks

PDA

Prediction: Probability that there is a “leak-like” event

$$P(\mathbf{C} | \mathbf{X}(t))$$

This is meta-model - a model whose inputs X_1, X_2, \dots are also models

Decision: IF ($P(\mathbf{C} | \mathbf{X}(t)) > \text{threshold}$) THEN (leak)

Action: Shut down the pumps

In DMV \rightarrow PDA,
which part is
Human
Intelligence
or Artificial
Intelligence
or both?

D = “machine”

M = human

V = human

P = “machine”

D = “machine”

A = human

Marketing

Human Intelligence

- ▶ V: Company A was losing market share to competitor
- ▶ D+M → P It was losing brand loyal consumers (measured in > 90% of wallet spend) to competitor
- ▶ DA to be taken by client afterwards

D →

Biggest spender

Lowest spender

M - loyals aren't very profitable

20% of \$1000 is better than 100% of \$100!

Marketing

“Artificial” Intelligence -
just less biased human intelligence really

D →

D →

M - Retailer A has lost all its competitive advantage to competitor B in the segment with the highest ROI

M - Retailer A's most brand “loyal” customers have been defecting to competitor B.

P - Given that there was an economic downturn between year 1 and year 4 Brand “Loyal” customers as defined by wallet spend are more price sensitive. These Loyalists are actually Switchers!

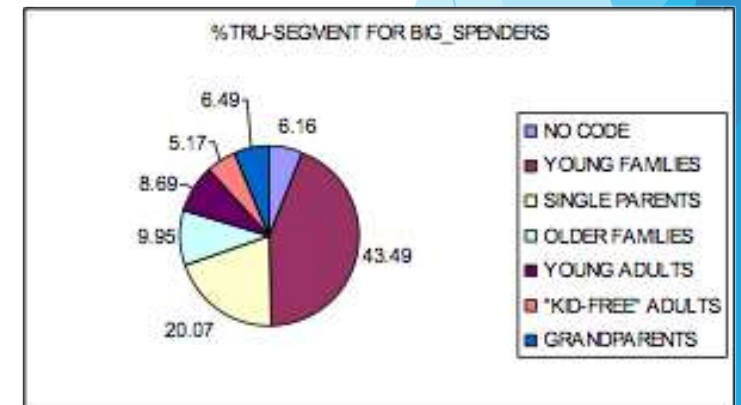

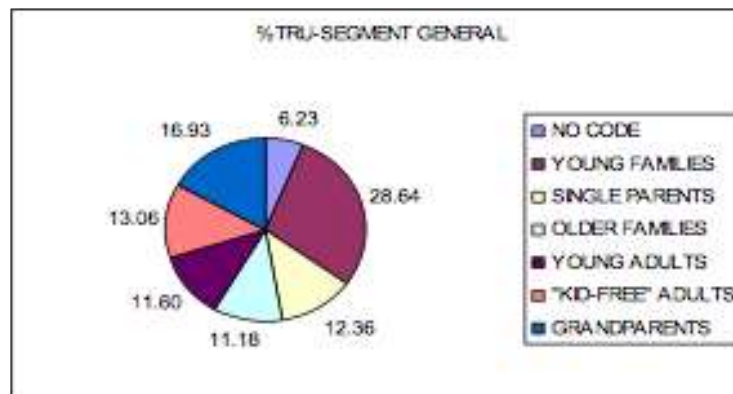

Marketing

D →

Profile variable	Value	Statistical significance (Std. devs)
Children under 18?	Yes	13.1
Second child's age	4-6	9.97
First child's age	4-6	9.2
Third child's age	7-9	8.87
Your age?	28-32	8.28
Persons in household	5	7.86
Total family income	> \$100,000	8.31
Gender	Male	7.31

P - Big Spenders are: “Young, high earning males with several young children”

P - Loyals are: “Low earners who live close to retailer A's stores and in their home territory”. It's easy to be loyal when its convenient

Loyals look like John Doe

P - $P(C | X(t))$

Predicting who will be a Big Spender - profile changes in Time

A good example of how to lose brand identity quickly.

AI P is better than HI P

Less biased
More multi-factorial

D + M

Year 4 attitudes Big Spenders	Statistical significance (std. devs)
Competitor B...Providing good value for the money?	3.23
Retailer A...assembling a bike or other purchase...?	3.18
Competitor B...the prices they charge for toys and games?	3.14
Competitor B...their selection of toys and games?	3.06
Competitor B...store where kids like to shop?	3.01
Competitor B...is a store that you would recommend to a friend for toys and games?	2.93
Competitor B...their sales and specials on toys?	2.87
Competitor B...assembling a bike or other purchase...?	2.68
Retailer A...their return and exchange policy...problem?	2.58
Competitor B...being the place that is fun for the whole family?	2.57
Competitor B...being in stock on the items you want to buy?	2.55
Competitor B...Makes you feel like a valued customer?	2.55

Wrap up...

Human Intelligence

- Everything you as an individual or as an organization do or will do in your life is governed by DMV→PDA, with Data as the Fuel of Life
- “Darwinian” evolution has selected those who do it well
- All data goes through our senses - in two forms - symbolic and non-symbolic
Non-symbolic data we process very fast; symbolic data we process very slow
- Meaning is an emergent property from data processing and is a result of millions of years of evolution
- Our data processing is VERY biased and a source of most of the world’s most intractable problems - obesity, war, poverty, addictions,...

Wrap up...

Artificial Intelligence

- ▶ The Data Revolution produces only symbolic information - a huge amount of it - we're drowning in it. If every person on the planet were a "Google" there'd still be too much data to process
- ▶ We don't speak "data base"
- ▶ Only Machine learning/AI algorithms can speak data base and process the data fast enough
- ▶ Unfortunately, they don't understand what any of it means

Wrap up...

Hybrid Intelligence

- ▶ The data that we are generating now is radically changing how we think about the world and act in it - for good and for bad
 - ▶ There is information there to cure and prevent diseases, reduce crime, reduce poverty, promote democracy, make money,...
 - ▶ There is information there to to acerbate diseases, to increase crime, to increase poverty, violate human rights, lose money,...
 - ▶ Only humans choose which data to look at, what value it has, what it means and what decisions and actions to take
- ▶ AI on its own won't solve anything complex - all we have are just electronic hammers - just very sophisticated ones
- ▶ However, AI can do things that no human can
- ▶ So, we need **Hybrid Intelligence** - Human + Machine
 - ▶ Render unto Caesar...
- ▶ We are all challenged to seek the optimal way to DMV → PDA - both in our jobs and our personal lives, embracing AI where it can help, where it can offset our cognitive biases, and understanding where it can't

Good luck with the challenge!

Thank you

Really Big Data At Walmart: Real-Time Insights From Their 40+ Petabyte Data Cloud

Bernard Marr Contributor @
Enterprise & Cloud

<https://www.forbes.com/sites/bernardmarr/2017/01/23/really-big-data-at-walmart-real-time-insights-from-their-40-petabyte-data-cloud/#677426616c10>

Walmart – the world’s biggest retailer with over 20,000 stores in 28 countries, is in the process of building the world’ biggest private cloud, to process 2.5 petabytes of data every hour.

Data

To make sense of all of this information, and put it to work solving problems, the company has created what it calls its Data Café – a state-of-the-art analytics hub located within its Bentonville, Arkansas headquarters.

Here, over 200 streams of internal and external data, including

Data

40 petabytes of recent transactional data, can be modelled,

Data

manipulated and visualized. Teams from any part of the business are invited to bring their problems to the analytics experts and then see a solution appear before their eyes on the nerve centre’s touch screen “smart boards”.

He said “If you can’t get insights until you’ve analyzed your sales for a week or a month, then you’ve lost sales within that time.

“If you can cut down that time from two or three weeks to 20 or 30 minutes, then that saves a lot of money for Walmart and stopped us losing sales. That’s the real value of what we have built with the data café.”

Value

For example Naveen told me about a grocery team who could not understand why sales had suddenly declined in a particular product category. The team came to the café to find out why, and by drilling into the data were quickly able to see that pricing miscalculations had been made, leading to the products being listed at a higher price than they should have been, in some regions.

Meaning
Value
Prediction
Human Intelligence

In another example, during Halloween, sales analysts were able to see in real-time that although a particular novelty cookie was very popular in most stores, there were two stores where it wasn't selling at all. The alert allowed the situation to be quickly investigated, and it was found that a simple stocking oversight had led to the cookies not being put on the shelves. The company was able to then rectify the situation immediately, avoiding further lost sales.

Meaning
Value
Prediction
Action
Human Intelligence

As well as 200 billion rows of transactional data (representing only the past few weeks!), the Café pulls in information from 200 sources including meteorological data, economic data, Nielsen data, telecom data, social media data, gas prices, and local events databases.

Anything within these vast and varied datasets could hold the key to the solution to a particular problem, and Walmart's algorithms are designed to blaze through them in microseconds to come up with real-time solutions.

Thanks to 4.5 billion years of evolution we can...

- Extract 11 Mb/s of sensory data that offer a “useful” representation of our environment
- Create predictive models by processing these data in our brains
- These predictive models enable us to make decisions and then act on them (or not)

Value comes from meaning

These actions have consequences...

- They imply a “value” for the data, its extraction, the predictive model, the decision and the action
- Without adequate data there are no effective decisions or actions

Sounds cool doesn't it?

Walmart – the world’s biggest retailer with over 20,000 stores in 28 countries, is in the process of building the world’s biggest private cloud, to process 2.5 petabytes of data every hour.

Algorithms can’t make “sense” of data

To **make sense** of all of this information, and put it to work solving problems, the company has created what it calls its Data Café – a state-of-the-art analytics hub located within its Bentonville, Arkansas headquarters.

Are all these streams of equal value?

Here, over 200 streams of internal and external data, including 40 petabytes of recent transactional data, can be modelled, manipulated and visualized. Teams from any part of the business are invited to bring their problems to the analytics experts and then see a solution appear before their eyes on the nerve centre’s touch screen “smart boards”.

What are the relevant variables?

How do you stimulate people to “see” the experts?

How many data scientists do you need?
Where will you find them?

After generating a new insight...
How quickly can you organize a
response/intervention?

He said “If you can’t get insights until you’ve analyzed your sales for a week or a month, then you’ve lost sales within that time.

“If you can cut down that time from two or three weeks to 20 or 30 minutes, then that saves a lot of money for Walmart and stopped us losing sales. That’s the real value of what we have built with the data café.”

What is the “value” of the insight?

How ready are your business
people to accept and
implement a result?

For example Naveen told me about a grocery team who could not understand why sales had suddenly declined in a particular product category. **The team** came to the café to find out why, and by **drilling into the data** were quickly able to see that pricing miscalculations had been made, leading to the products being listed at a higher price than they should have been, in some regions.

Is this the real reason?
Correlation vs causation.

In another example, during Halloween, **sales analysts** were able to see in real-time that although a particular novelty cookie was very popular in most stores, there were two stores where it wasn't selling at all. The alert allowed the situation to be quickly investigated, and it was found that a simple stocking oversight had led to the cookies not being put on the shelves. The company was able to then rectify the situation immediately, avoiding further lost sales.

How many possible insights do you think there are in the whole organization?

What's its value?

Who assigns value?

The analysts?

The teams?

Both?

How do you anticipate problems?

How do we predict?

As well as 200 billion rows of transactional data (representing only the past few weeks!), the Café pulls in information from 200 sources including meteorological data, economic data, Nielsen data, telecom data, social media data, gas prices, and local events databases.

The problem!

Anything within these vast and varied datasets could hold the key to the solution to a particular problem, and Walmart's algorithms are designed to blaze through them in microseconds to come up with real-time solutions.

Human “Intelligence” or Artificial “Intelligence”

Man and Machine
or
Man versus Machine

$P(C | X(t))$ are prediction models

You can answer all your questions and solve all your problems!

Where do I get one?

First, choose your “black box” $P(|)$

Where do I get a “black box”? **Make your choice!**

IBM PowerAI Platform

PowerAI Software Distribution: Optimized for Power

Deep Learning Frameworks & Enhancements	TensorFlow	Caffe	IBM Caffe	Watson APIs
Supporting Capabilities And Libraries	IBM Distributed Deep Learning	Power Systems Large Model Support	AI Vision Tools	IBM Spectrum Accelerator
