

To boldly go where no  
man has gone before

# Data in Science versus Data Science: What's the difference?

**Chris Stephens**

C3-Centro de Ciencias de la Complejidad y Instituto de Ciencias Nucleares, UNAM

MexiCOPAS

Universidad de Guanajuato 02/05/2017

- 
- 1. Why do we need data in science?**
  - 2. Isn't all science "data science"?**
  - 3. Why do we talk about data science now?**
  - 4. What's the difference?**

DATA

# And the “modern” approach? Data Science —> Data Mining

---

“... the exploration and analysis of data in order to discover patterns, correlations and other regularities.”

There are two main datamining tasks

Predicting – “pattern” identification

Establishes “causal” statistical relations

Profiling - “pattern” description

Identifies what are the key drivers associated with a pattern

There are three main requirements

Data; “data processors”; “inference algorithms”

**We're all equal under the law**

---

# Universality

We're all equal under the law

---

But in physics and chemistry...

# Universality

We're all equal under the law

---

# Universality

**We're all equal under the law**

---

**there's really not a lot to say**

# Universality

We're all equal under the law

---

# Universality

We're all equal under the law

---

**once you've seen one perfect gas  
you've seen them all!**

# Universality

**We're all equal under the law**

---

# Universality

We're all equal under the law

---

At all times and in all places

# Universality

We're all equal under the law

---

# Universality

We're all equal under the law

---

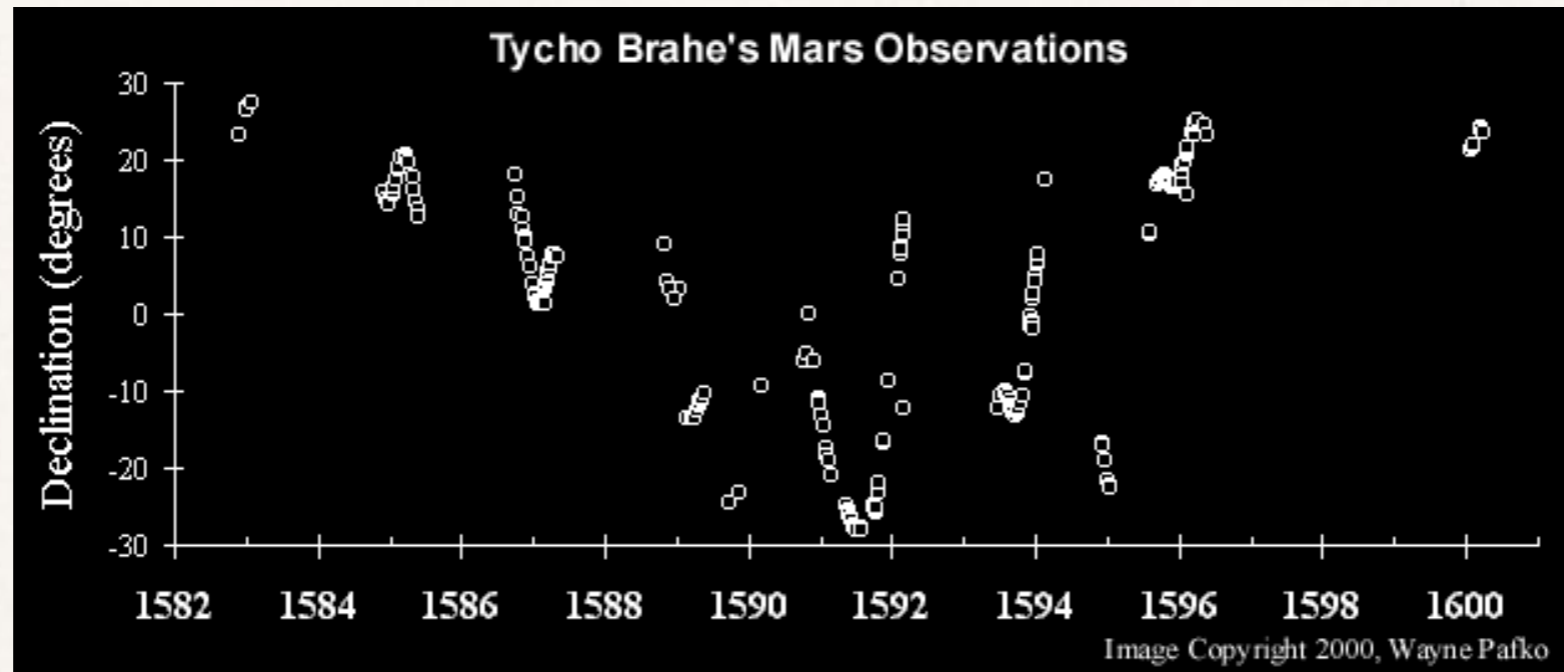

**In general, you don't need  
that much data**

# Isn't all Science Data Science?

Data —> Phenomenology —> Taxonomy —> Theory

Data

Phenomenology

## Kepler's Laws

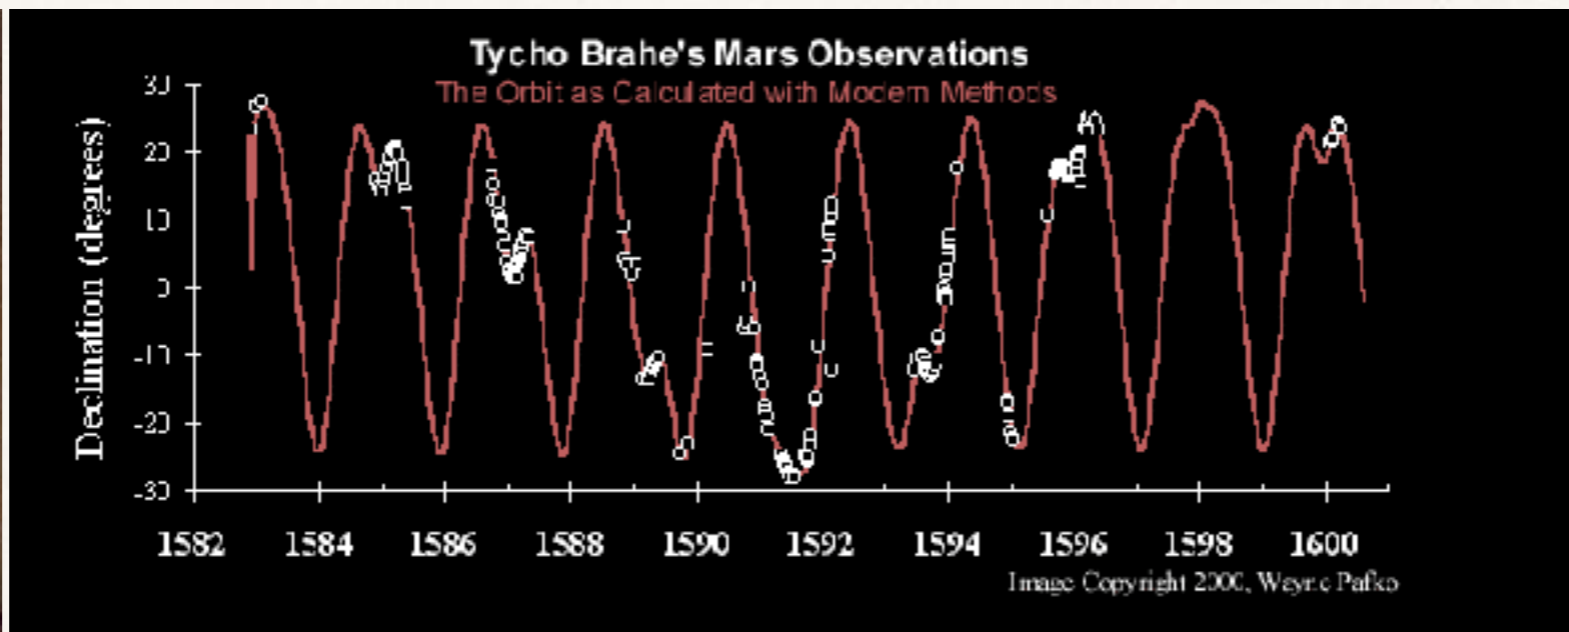

1. The **orbit** of a planet is an **ellipse** with the Sun at one of the two **foci**.
2. A line segment joining a planet and the Sun sweeps out equal areas during equal intervals of time.
3. The square of the **orbital period** of a planet is proportional to the cube of the **semi-major axis** of its orbit.

# Isn't all Science Data Science?

Data —> Phenomenology —> **Taxonomy** —> **Theory**

## Theory

$$F = ma$$

$$F = GMm / r^2$$

Isaac Newton computed the **acceleration** of a planet moving according to Kepler's first and second law.

- 1 The *direction* of the acceleration is towards the Sun.
- 2 The *magnitude* of the acceleration is inversely proportional to the square of the planet's distance from the Sun (the *inverse square law*).

This implies that the Sun may be the physical cause of the acceleration of planets.

Newton defined the **force** acting on a planet to be the product of its **mass** and the acceleration. So:

- 1 Every planet is attracted towards the Sun.
- 2 The force acting on a planet is in direct proportion to the mass of the planet and in inverse proportion to the square of its distance from the Sun.

The Sun plays an unsymmetrical part, which is unjustified. So he assumed, in **Newton's law of universal gravitation**:

- 1 All bodies in the solar system attract one another.
- 2 The force between two bodies is in direct proportion to the product of their masses and in inverse proportion to the square of the distance between them.

As the planets have small masses compared to the Sun, the orbits conform approximately to Kepler's laws. Newton's model fits actual observations more accurately.

# Science Data Science?

- 
- ❖ **Data:** Brahe provided an accurate (for the time) data base with data on the positions of different celestial bodies as a function of time.
  - ❖ **Phenomenology:** Kepler was a data miner, a data scientist. He mined Brahe's data and **inferred** regularities and constructed phenomenological models (his three laws) that embodied these regularities.
  - ❖ **Theory:** Newton used Kepler's laws to construct a theoretical, "universal" model for the gravitational interaction. He **inferred** the existence and nature of an interaction between objects.

## • Where things are as a function of space and/or time allows us to infer the nature of their interactions.

- By observing the spatio-temporal behaviour of different types of inanimate "things" we have deduced that in the physical world there are 4 interaction types and they are important at quite different scales.
  - There are only very few properties/labels of "things" that are associated with the different interactions: mass, electric charge, weak isospin, colour
  - These interactions DO NOT change!

# Data then versus data now

# Data then versus data now

## There's been a data revolution...

# Data then versus data now

There's been  
a data revolution...

But just what's  
revolutionary?

# What's revolutionary?

Data types? No.

Raw data:  
Chemical  
Electromagnetic  
Acoustic...

as functions of space and time tell us what is going on in the world.

We use data about *events* to take *decisions.*

# Data sensing?

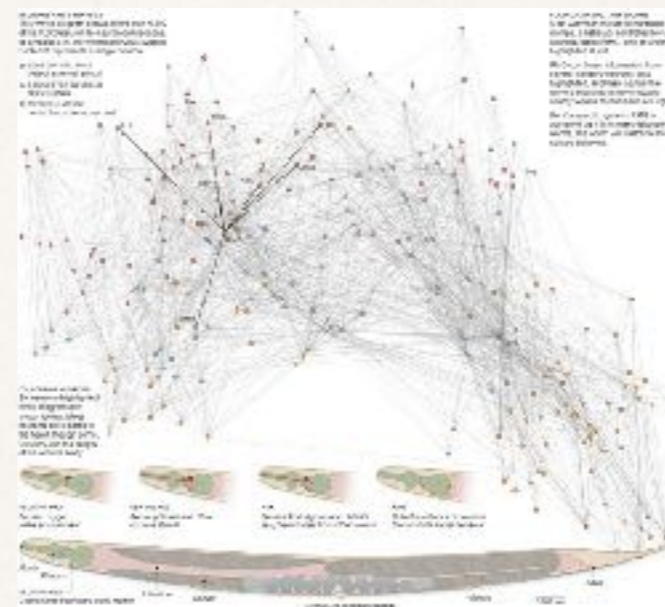

# Data sensing? Yes.

# Data storage and processing?

Human brain

10-100 Terrabytes

Worm neural network 0.3MB

Genomes 1kB - 1.5 GB

Data growth by type

# What's revolutionary?

Data storage and processing? Yes.

---

We can now track and record what is happening in the world like never before.

For example, a financial market where...

every transaction that occurs is processed (a summary of relevant information is determined) and then electronically stored.

A screenshot of a Bloomberg terminal window titled "Order" and "Bloomberg". The window displays a "CREDIT SUISSE FX TWAP Algo" order form. The form includes the following fields:

Type	Spot	
Pair	EURUSD	Buys EUR
Tenor	SPOT	09/10/2008
Amount	12,000,000.00	EUR
Order Type	Limit	
Limit Price	1.4125	
Start Time	10:00:00	
End Time	14:00:00	
Execution Style	Normal	

At the bottom of the form, there are two buttons: "Submit" (green) and "Close" (grey).

# What's revolutionary?

Data connectivity? Yes.

Then

Real space --> cyberspace

Now

# Data connectivity?

---

# Data connectivity? Yes.

---

**Data connectivity? Yes.**

**But just how connected are we?**

**Victorian education reform**: Education Act 1870. Perspective view of Harper Street  
School, New Kent Road, London, 1885. Print Designer: Robert W Edis ...

Humans are wonderful at  
semantics, machines aren't

# What's revolutionary?

Data communication speed? Yes, but not like you imagine?

# What's revolutionary?

Data purpose? No.

---

- ❖ We have always used data to take decisions
- ❖ There has always been an “evolutionary pressure” in favour of those who can record, process, store and analyse more efficiently and more precisely data in order to make better decisions

# Data analysis?

Instinct: Hard-wired data analysis

Learning: adaptive data analysis

Automated data analysis - **data mining**.  
Can consider large volumes of data with large numbers of variables

# Data analysis? Yes.

Instinct: Hard-wired data analysis

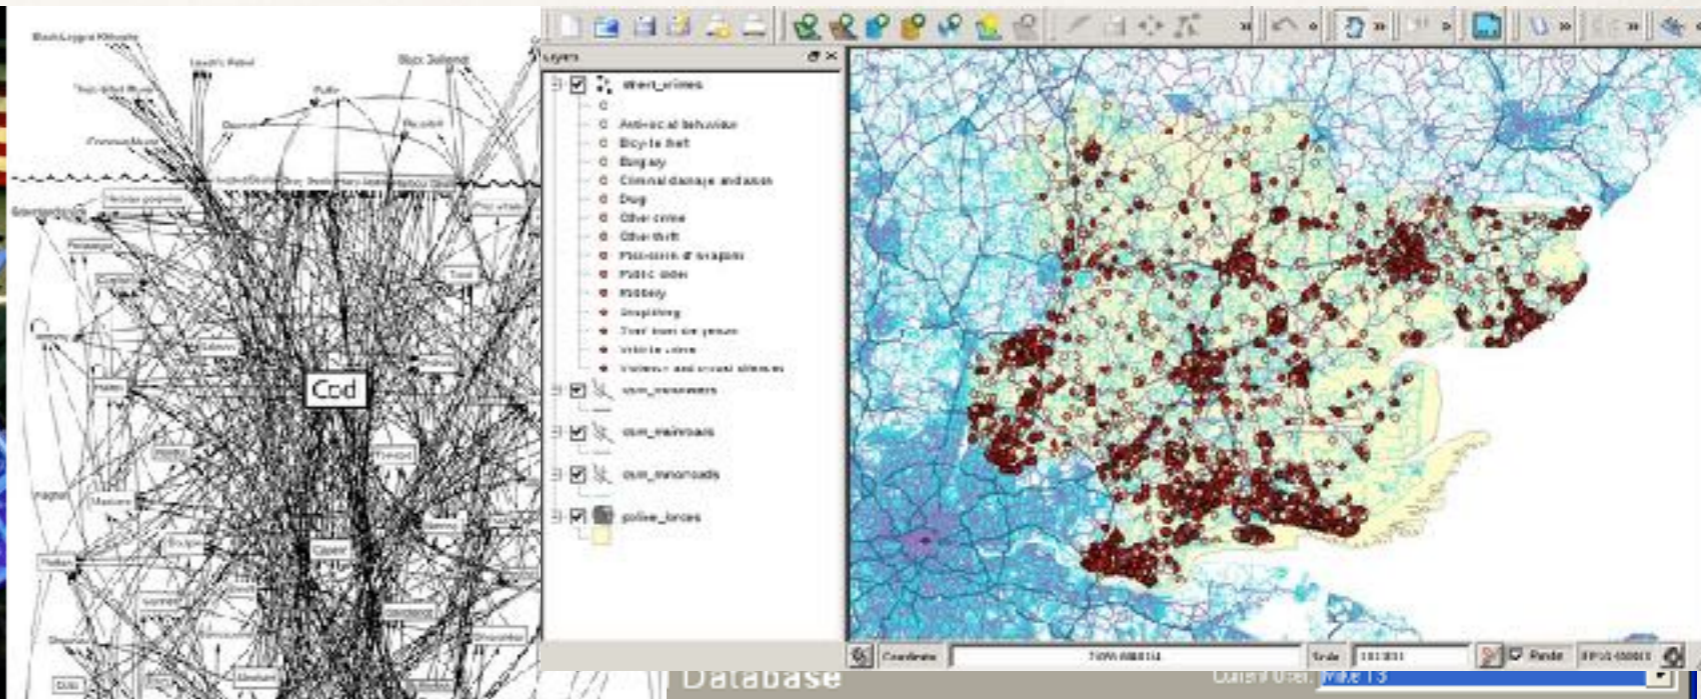

Learning: adaptive data analysis

Automated data analysis - **data mining**.  
Can consider large volumes of data with large numbers of variables

# What does all the data from the data revolution represent?

# In Complex Adaptive Systems we need a lot of data because...

---

Imagine what you can  
say about a city

versus

# In Complex Adaptive Systems we need a lot of data because...

---

Imagine what you can say about a city

versus

a crystal as big as a city!

# In Complex Adaptive Systems we need a lot of data because...

---

Imagine what you can say about a city

versus

a crystal as big as a city!

The difference between **BIG** data  
and **DEEP** data

**You can say a lot about a Complex Adaptive System and each thing you say depends on a lot of other things**

---

**Any observable of a complex system depends on a whole host of other factors**

**$P(A,B,C,D,\dots; t \mid a,b,c,d,\dots; t')$**

Diabetes	Renal failure	Obesity	Father had diabetes
Angina	Leukaemia	SNP Rs7903146	45 mins exercise per week

**Many effects**      **Many causes**  
**From the “micro” to the “macro”**

**Many disciplines**

---

**The data revolution is revolutionising our ability to study the immensely rich phenomenology of complex systems and construct more appropriate taxonomies**

# What distinguishes complex from non-complex phenomena?

---

## Structural properties

A “hierarchy” of many different scales

Effective degrees of freedom (“collectivity”) that are qualitatively different at different scales

Hierarchies of **building blocks** (modularity)

Interactions that are stronger “intra-block” than “inter-block”

The micro and macro and linked through feedback (fitness, meaning,...)

## Functional properties

Systems that are adaptive

A dynamics that depends on many different rules/strategies

Systems that “**learn**” (feedback from the environment to the system that is used to update the rules)

The micro and macro and linked through feedback (fitness, meaning,...)

More complex behaviour (the “phenotype”)

Better described by what they **DO** than what they **ARE**

---

# **Is complexity a scientific concept?**

**If it is, then...**

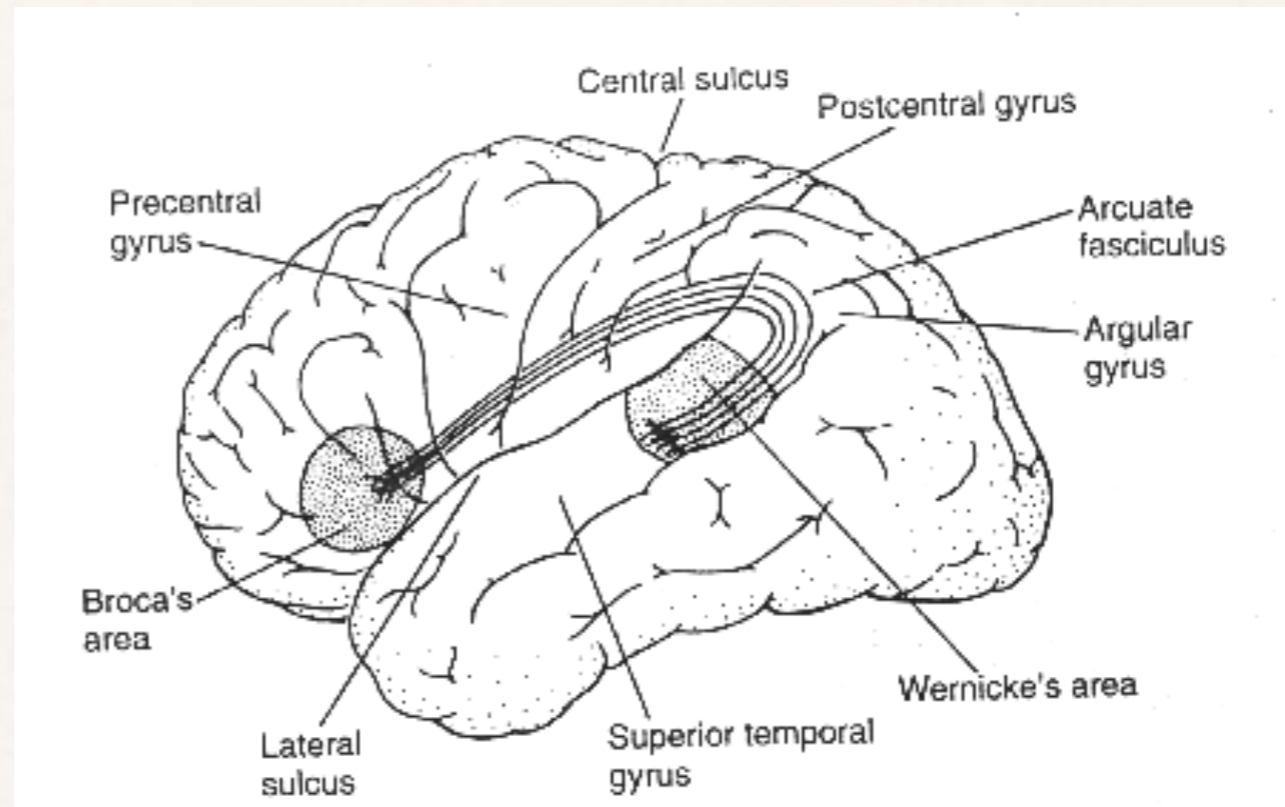

**How do we measure it?**

**What is a good measuring apparatus...?**

# For Symbolic Complexity

**To be or not to be that is the question.**

This apparatus is surely capable of measuring complexity. Or maybe not...?

# How good is your apparatus?

- To be or not to be that is the question.
- Para ser o no ser que es la pregunta.
- Om te zijn of te zijn niet dat de vraag is.

あるためまたはないため質問である

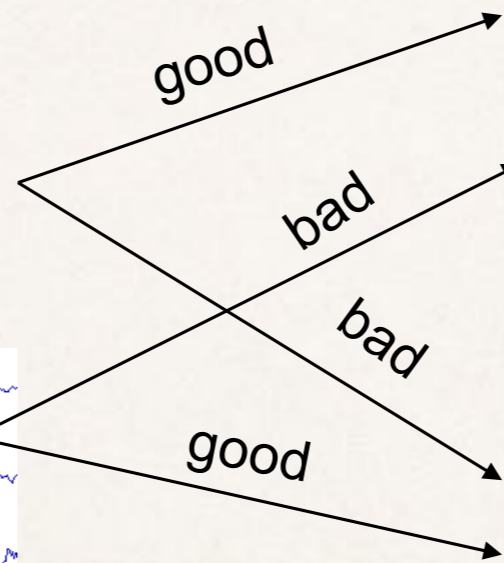

- Because of a certain or because it is not, it is question.
- Because or it is not for the sake of, that having asked and being convinced.
- Being not to be for the sake of, or that that, you ask, are convinced.
- It is that without having for the sake of, or, you ask, are convinced.

# Is this different to physics?

# Modeling complexity

---

---

**To make a mathematical  
model of a dynamical  
system...**

---

**To make a mathematical  
model of a dynamical  
system...**

**we need a space of states**

---

**To make a mathematical  
model of a dynamical  
system...**

**we need a space of states  
and update rules that tell us how  
to get from one state to another**

# Does this represent a Complex System?

$$\mathbf{d}_i(t + \Delta t) = \sum_{j \neq i} \frac{\mathbf{c}_j(t) - \mathbf{c}_i(t)}{|\mathbf{c}_j(t) - \mathbf{c}_i(t)|} + \sum_{j=1} \frac{\mathbf{v}_j(t)}{|\mathbf{v}_j(t)|}$$

Competition between an effective repulsion and attraction between “particles”

$$\hat{\mathbf{d}}_i(t + \Delta t) = \mathbf{d}_i(t + \Delta t) / |\mathbf{d}_i(t + \Delta t)|$$

$\mathbf{c}_i(t), \mathbf{v}_i(t)$  – position/direction vectors of a “particle”

$$\mathbf{d}_i'(t + \Delta t) = \frac{\hat{\mathbf{d}}_i(t + \Delta t) + \omega \mathbf{g}_i}{|\hat{\mathbf{d}}_i(t + \Delta t) + \omega \mathbf{g}_i|}$$

Equation for “charged” particles in an external field  $\mathbf{g}_i$

**Couzin, I.D., Krause, J., Franks, N.R. & Levin, S.A.**  
(2005) *Nature*, **433**, 513-516.

## Does this represent a “complex” system?

---

**Moral: It's important to distinguish between a description of complexity and a non-complex description of a phenomenon or behaviour associated with a complex system.**

# Predictability in physical systems versus Complex Adaptive Systems

---

# Predictability in physical systems versus Complex Adaptive Systems

---

The difference between complex and simple systems is the difference between  
“being” and “doing”

# Predictability in physical systems versus Complex Adaptive Systems

---

# Predictability in physical systems versus Complex Adaptive Systems

---

# Predictability in physical systems versus Complex Adaptive Systems

# Predictability in physical systems versus Complex Adaptive Systems

Mechanistic

# Predictability in physical systems versus Complex Adaptive Systems

**Mechanistic**

# Predictability in physical systems versus Complex Adaptive Systems

Mechanistic

Adaptive

The *evolution* of function  
is the revolution that allowed  
systems to escape the tyranny  
of the laws of physics.  
Complexity is a consequence  
of that revolution.

# The Difference Between “Being” and “Doing”

---

In biological, economic and social systems, i.e., complex adaptive systems, organisms exhibit a great diversity of **STRATEGIES (rules/models)** that lead to decisions. A strategy can be viewed as a sequence of decisions.

The dynamical state of an individual at  $t+1$  depends not only on the state of the individual at other times  $t$  but also on the strategy (update rule) selected at time  $t$ , that in turn depends on the rules of others at  $t$ . Thus, it is necessary to work in a space of states AND strategies/rules/models – sounds like game theory but

...

# We don't know what this space is!

---

Besides, the payoff for a strategy is **RELATIVE** not absolute. Payoff (fitness) should be an emergent property. Imagine at the beginning of life trying to specify a priori the fitness of a lion or an ant!

# Conclusions:

---

- ❖ All science is “data science” - from its beginnings to the present day. There is no science without data.
- ❖ Because of universality physical systems are relatively phenomenologically poor (**big** data but not **deep**!) and therefore need relatively little (shallow) data (CERN, LIGO, etc. notwithstanding)
- ❖ Phenomena at one scale in the physical sciences is shielded from the rest (“effective theories”) and that’s why physics has been so successful
- ❖ Complex Adaptive Systems are phenomenologically deep and need a lot of data to describe them...

# Conclusions: The data revolution

---

- ❖ We are generating 1 Zettabyte of data per year. That's about 1 Terrabyte per person per year. That's more than a million books!
  - ❖ Humans can't use or analyse all of that data
  - ❖ Should we just dump it or ignore it?
  - ❖ There is a huge potential for good (or ill) in much of the data
  - ❖ Who should have access to it?
  - ❖ Who should decide how its to be used?
- ❖ The collection, use and abuse of this data will probably be the most significant factor in our history over the next 100 years

# Conclusions: Complex Adaptive Systems

---

- ❖ We don't have adequate conceptual or theoretical frameworks in which to understand complex adaptive systems or complexity
  - ❖ Physical systems “are”, while complex (adaptive) systems “do”
  - ❖ Physical systems are described by few relevant variables, for complex adaptive systems there are many that range from the micro to the macro
- ❖ Good science starts with phenomenology and taxonomy before moving on to theory - we have many “Brahes” but we need more “Keplers” and less “Newtons”
- ❖ Basically all the data generated in the data revolution is “non-scientific” and is associated with complex adaptive systems
- ❖ The traditional modeling frameworks of the physical sciences are much less useful in the Complex Sciences
- ❖ Data mining / machine learning / Deep learning / ... are just methodological tools to help us be better “Keplers”. They offer the best way to attack this data. Its also the appropriate way to develop a better phenomenological and taxonomic understanding of complex adaptive systems

δῶς μοι πᾶ στῶ καὶ τὰν γᾶν κινάσω  
Give me a place to stand on and I'll move the earth

δῶς μοι πᾶ στῶ καὶ τὰν γᾶν κινάσω

Give me a place to stand on and I'll move the earth

**Give me enough data and I'll predict anything**
